

Sagnac experiment revised

Please repeat the Sagnac effect experiment with four mirrors on a circular rotation, but with the following difference:

- The mirrors must not be straight, but exactly curved as the circle itself, thus removing different angles and distances from the experiment setup.
- Make sure the room does not contain air or electrons (preferably near vacuum) to prevent interaction or re-emission of light due to interactions with electrons.

According to this theory, the Sagnac effect will vanish and not be existent in this corrected setup.
